Plasticity of monocytes/macrophages: phenotypic changes during disease progression Ruoxi Yuan,Chao Yang,Yanan Ma,Liwu Li,2023-12-07 Macrophage is a key component of innate immunity that exhibit extensive plasticity and heterogeneity. They are present in virtually every organ of the body and can be replenished by circulating monocytes following insults. Originally macrophages were divided into two major phenotypes: pro-inflammatory M1, which is initiated by TNF- α , INF- γ , and bacterial components such as lipopolysaccharide (LPS), and anti-inflammatory M2, which is activated through stimulation of IL-4, IL-10, and IL-13. However, segregation into two distinct phenotypes is a marked simplification of the in vivo reality and it is now widely accepted that macrophage phenotype is plastic and determined by highly complex microenvironments, and therefore likely more accurately considered as a spectrum of possible forms of activation. Numerous studies have documented flexibility in their programming, with macrophages switching from one functional phenotype to another in response to the variable microenvironmental signals of the local milieu. Various macrophage populations exist that play distinct and non-redundant roles in fibrosis, tissue repair, and regeneration. For instance, in a general wound healing process, embryo-derived tissue-resident macrophages are rapidly replaced by monocytes after the initial injury. These monocyte-derived macrophages play an active role in the early initiation of acute inflammation. As early as 24-72 h upon tissue injury, macrophage function changes toward an anti-inflammatory phenotype that promotes cell proliferation and tissue remodeling. Upon resolution of inflammation, steady-state self-maintenance of macrophages is also recovered. The wound microenvironment has a predominant role in the behavior and functionality of cells. Both mouse and human diabetic wound preferably induce persistent proinflammatory macrophage polarization that contributes to chronic, non-healing wounds. Contrastingly, prolonged activation of M2 macrophages can also lead to excessive wound healing and ultimately fibrosis. In the context of cancer, anti-inflammatory macrophages have been associated with tumor progression and immunosuppression, thereby negatively affecting the prognosis of patients. On the other hand, studies also showed that the phenotypical changes of macrophages are also accompanied by changes in glycolysis and mitochondrial-related genes as well. Classically activated, proinflammatory M1 macrophages depend to a large extent on glycolysis and produce lactate as the tricarboxylic acid cycle is blocked at two steps. Alternatively, activated M2 macrophages prefer β -oxidation and oxidative phosphorylation to synthesize ATP. However, the number and diversity of signals and the magnitude of the response required

to switch macrophages into a pro or anti-inflammatory state remain unclear. A number of techniques have been developed over the years to identify and visualize cell populations, uncover regulatory relationships between genes, and track the trajectories of distinct cell lineages in development. The identification of mechanisms and molecules associated with macrophage plasticity and polarized activation provides a basis for macrophage-centered diagnostic and therapeutic strategies. Understanding and being able to controllably promote the desired macrophage phenotypes could have a significant impact on a wide range of diseases.

Gram-Positive Pathogens Vincent A. Fischetti, Richard P. Novick, Joseph J. Ferretti, Daniel A. Portnoy, Mirian Braunstein, Julian I. Rood, 2019-10-01 Gram-positive bacteria, lacking an outer membrane and related secretory systems and having a thick peptidoglycan, have developed novel approaches to pathogenesis by acquiring (among others) a unique family of surface proteins, toxins, enzymes, and prophages. For the new edition, the editors have enhanced this fully researched compendium of Gram-positive bacterial pathogens by including new data generated using genomic sequencing as well as the latest knowledge on Gram-positive structure and mechanisms of antibiotic resistance and theories on the mechanisms of Gram-positive bacterial pathogenicity. This edition emphasizes streptococci, staphylococci, listeria, and spore-forming pathogens, with chapters written by many of the leading researchers in these areas. The chapters systematically dissect these organisms biologically, genetically, and immunologically, in an attempt to understand the strategies used by these bacteria to cause human disease. "This textbook comprises a superb collection of scientific knowledge making it a must-read

for any graduate student, medical doctor, or investigator studying these gram-positive bacteria and inspiring future imaginations of biological knowledge.” - William R. Jacobs, Jr., PhD, Professor Microbiology & Immunology, Albert Einstein College of Medicine

Cardiovascular Diseases Related to Diabetes and Obesity Volume II Lu Cai,Ying Xin,Jamie Lynn Young,Rajesh Mohanraj,2022-11-14

Macromolecular Protein Complexes J. Robin Harris,Jon Marles-Wright,2017-03-07 This volume of the established Subcellular Biochemistry series presents 20 chapters dealing with a broad range of interesting protein complexes. It will enable researchers to readily appreciate the major contribution from both X-ray crystallography and cryo-electron microscopy in this field of study. The biological significance of these structural studies is emphasised throughout the book. The diversity of the material included here indicates the breadth of this field and the tremendous progress that has been made in recent years. The book is directed primarily to advanced students and researchers in structural biology, and others in the biochemical sciences. It will be supplemented by other related books within the Subcellular Biochemistry series. One of the Editors (JM-W) is actively involved in structural biology and the other (JRH), as a retired academic and the Series Editor of Subcellular Biochemistry, has long experience at editing multi-author books./div

The Aging Immune System and Health Valquiria Bueno,Rafael Solana,Annemieke Boots,2020-01-15 The world population presents an increased percentage of individuals over 65 years old and the fastest growing subgroup is over 85 years old. The increase in life expectancy observed in the last century has not been synonymous with extra years lived in good health (disability-free years). Population studies have shown that as individuals age, they can present a great heterogeneity of ability and health. Therefore, aging has been associated for some individuals with disabilities and hospitalizations. Deaths related to infectious pathogens are increased in the aging population mainly due to pneumonia and influenza whereas Cytomegalovirus, Epstein-Barr virus, among other viruses seem to contribute to the low-grade inflammatory process observed (inflammaging). Aging is a complex and multifactorial process in which functions of the organism are adjusted (remodelled) in order to deal with damaging events during life. One of the most important changes in aging individuals occurs in the immune system (innate and adaptive responses) with consequences such as poor response to new infections and vaccinations; increased susceptibility to cancer development and autoimmune diseases; frailty, and organ dysfunction. In addition, it has been proposed that immunosenescence not only reflects the aging of the organism but also contributes to this process. Bone marrow presents decreased hematopoiesis, the thymus undergoes involution and lymphoid organs (lymph nodes, spleen) also present reduced functionality. Therefore, cells derived, matured, or residing in these tissues decline in number and function. These changes have been identified in experimental models, in vitro conditions, peripheral blood, and biopsies via biomarkers such as cell phenotype, stimulus-induced proliferation, cytokines and

antibodies levels. Telomere length and telomerase activity also decline in bone marrow-derived and peripheral blood cells and have been shown to play a role in immunosenescence. More recently, the investigation of short non-coding RNA molecules (microRNAs; miRNAs) pointed to this system as a possible control of aging-related mechanisms. Data obtained on these markers for aging individuals could lead to the generation of a marker panel for pathology prediction, to indicate interventions, and to evaluate the efficacy of interventions. Interventions such as nutrition supplements, exercise, vaccination (different dose, concentration of antigen, adjuvants) have been proposed to circumvent age-related diseases. Considering the heterogeneity in the aging process, further investigation is vital before the indication of interventions for aging individuals. As the extension of life expectancy is a reality, it is a challenge to understand how the aging population copes with the remodelling of the organism and how interventions could provide longevity in good health.

Molecular Aspects of Hepatocellular Carcinoma Liang Qiao,Yumin Li,Xiang Yan,Jacob George,2012 Therapeutic options for late-stage liver cancer are very limited and the prognosis is often poor. A better understanding of the molecular mechanisms involved in the initiation, progression, and metastasis of hepatocellular carcinoma is critical for developing more rational diagnostic and therapeutic approaches. This e-book covers current developments on clinically relevant research on the molecular biology of hepatocellular carcinoma. This e-book should be a valuable reference for professional gastroenterologists, hepatologists and oncologists as well as medical students and researchers.
