

The Golden Of Chemistry

LeGrande M. Slaughter

The Golden Book of Chemistry Experiments, 2021-07-24 The Golden Book of Chemistry Experiments was a children's chemistry book written in the 1960s by Robert Brent and illustrated by Harry Lazarus and published by Western Publishing in their Golden Books series. Many of the experiments contained in the book are now considered highly dangerous for unsupervised children, and would not appear in a modern children's chemistry book. Only 126 copies of this book exist in libraries worldwide. The book was a source of inspiration to David Hahn, nicknamed "the Radioactive Boy Scout" by the media, who tried to collect a sample of every chemical element and also built a model nuclear reactor, which led to the involvement of the authorities. This book is now considered quite RARE and a Scientific Gem, and so we are happy to have made this available for Print!! Gold Chemistry Fabian Mohr, 2009-04-20 Written by world-class authors, this most recent major book on the topic highlights new and current trends as well as future directions. It is comprehensive in its scope, covering all aspects of gold chemistry -- from homogeneous to heterogeneous catalysis, from supramolecular assemblies to sensors and medicinal applications. The result is an invaluable work for both organic and inorganic chemists working in universities and industry, as well as material scientists.

The Chemistry of Organogold Compounds, 2 Volume Set Zvi Rappoport, Ilan Marek, Joel F. Liebman, 2015-04-20 The first book in the PATAI Series was published in 1964 and the Series will celebrate its 50th Anniversary in 2014. This Golden

Jubilee is accompanied by the publication of the first volume on the chemistry of organogold. In the history of the PATAI Series there was, so far, no volume dedicated to gold alone. In 1999 we published a volume on The Chemistry of Gold and Silver Compounds. Since then a lot of new chemistry using gold has been developed and it is timely to focus a volume on methods and applications of organogold compounds in organic synthesis, reflecting the enormous progress which has been made in the use of gold compounds as reagents and catalysts. A second area of great importance covered in the book is the use of gold surfaces in the synthesis of peptides, proteins and other natural products. A whole range of applications in the area of biochemistry has resulted from these developments. A third area of interest is the synthesis and engineering of nanostructures, where organogold chemistry has opened the door for a wide range of methods and applications in the field of nanoscience and materials science. As with all new volumes, the chapters are first published online in Patai's Chemistry of Functional Groups. Once a volume is completed online, it is then published in print format. The printed book offers the traditional quality of the Patai Book Series, complete with an extensive index.

Gold Christopher Corti, Richard Holliday, 2009-12-02 Gold is used in a wide range of industrial and medical applications and accounts for over 10 percent of the annual demand for metal, worth billions of dollars annually. While much has been written about the mystique and trade of gold, very little has been written about the science and technology in which it is involved. Edited by two respected auth

Recent Advances in Understanding Gold Deposits T. Torvela, R.J. Chapman, J. Lambert-Smith, 2022-12-06 Gold occurs in many settings, but the dynamic nature of Earth's crust means overlapping and overprinting deposit styles are common. Characterization of mineralization from an early stage becomes important, particularly where the mineralization is complex, in order to maximize exploration and project development success and mining productivity. Various techniques are used at different stages of a project to characterize gold deposits. This Special Publication offers a cross-section of some specific techniques used to investigate a variety of gold deposit types. The papers highlight both the breadth of the available techniques and their utility in deposit characterization, but also the many significant remaining questions and problems related to the exploration and research of gold deposits. Several papers include suggestions of avenues for fruitful further research, including a paper discussing a new approach to classifying orogenic gold deposits, and a paper describing archaeological applications of natural gold analyses.

Metal Compounds in Cancer Therapy S.P. Fricker, 2012-12-06 The discovery of the antitumour activity of cisplatin in 1965 and its subsequent introduction into clinical trials in 1971 was the catalyst for a major international research effort investigating the potential of metal compounds in cancer therapy. Cisplatin now occupies an important place in the armamentarium of the oncologist due to its effectiveness in the treatment of testicular cancer. A second generation analogue, carbo platin, offers reduced toxicity together with therapeutic activity, which gives it a place in the front-line therapy of genitourinary cancers. These and other successes have encouraged the search for novel metal-based drugs for cancer therapy. Research has shown that metal compounds have potential for activity not only as cytotoxic antitumour agents, but also in areas such as adjuvant therapy, diagnosis and immunotherapy. The aim of this book is to review and describe the major achievements and developments arising from this international research effort. The contributing authors come from laboratories throughout Europe and America and represent the many disciplines characteristic of this research, such as clinical research, pharmacology, tumour biology and inorganic medicinal chemistry.

Synthesis and Original Reactivity of Copper and Gold Complexes Maximilian Joost, 2015-06-13 This thesis addresses the coordination chemistry and reactivity of copper and gold complexes with a focus on the elucidation of (i) the metal-mediated activation of σ -bonds and (ii) the migratory insertion reaction. Both processes are of considerable importance in organometallic chemistry, but remain elusive for Cu and Au complexes. In this work, the author contributes significant advances: The first σ -SiH complexes of copper are experimentally and computationally characterized, yielding valuable insights into σ -bond activation processes for copper. Evidence for a highly unusual migratory syn insertion of unsaturated organic molecules into the gold-silicon bond of silylgold (I) complexes is provided and the corresponding mechanism identified. The intermolecular oxidative addition of σ -SiSi, σ -CC and σ -CX (X=halogen) bonds with molecular gold (I)

complexes is studied in detail, effectively demonstrating that this reaction, usually considered to be impossible for gold, is actually highly favored, provided an adequate ligand is employed. The use of small-bite angle bis (phosphine) gold (I) complexes allows for the first time the oxidative addition of σ -CC and σ -CX bonds for gold (I). These results shed light on an unexpected reactivity pattern of gold complexes and may point the way to 2-electron redox transformations mediated by this metal, opening up new perspectives in gold catalysis.

Supramolecular Gold Chemistry Rodolphe Antoine, 2020-06-23 This book is about supramolecular gold chemistry. This book provides a unique international forum aimed at covering a broad description of results involving the supramolecular chemistry of gold with a special focus on the gold-sulfur interface leading to hybrid materials ranging from gold-thiolate complexes to thiolate-protected gold nanoclusters and gold-thiolate supramolecular assemblies or nanoparticles. The role of thiols on the structure and optical features of gold nanohybrid systems (ranging from plasmonic gold nanoparticles and fluorescent gold nanoclusters to self-assembled Au-containing thiolated coordination polymers) is highlighted in the 12 papers presented in this book.

The Formation of the German Chemical Community 1720-1795 Karl Hufbauer, 2023-11-15 The Formation of the German Chemical Community (1720-1795) delves into the development of the chemical discipline in Germany during the 18th century, specifically focusing on the social and institutional conditions that led to the creation of a national community of chemists. The study examines how chemists in Germany began to perceive themselves as a cohesive professional group, united by shared goals and responsibilities, and how this solidarity influenced their reception of revolutionary scientific ideas, such as Lavoisier's theory. Through a thorough analysis of key figures, journals, and institutional histories, the book provides a nuanced understanding of the intellectual and social networks that fostered the rise of chemistry as a distinct scientific field in Germany. The book explores how the German chemical community was shaped not just by intellectual currents but also by external support from the Enlightenment, including financial and moral backing from state and academic institutions. It emphasizes how chemists, particularly those following the rational-utilitarian approach led by figures like G. E. Stahl, distanced themselves from alchemy and iatrochemistry, positioning chemistry as a rational science with wide-reaching practical applications. By tracing the formation of this community and its response to scientific revolutions, the author argues that the evolution of chemistry in Germany during the 18th century played a crucial role in the professionalization of the science in the 19th century. This title is part of UC Press's Voices Revived program, which commemorates University of California Press's mission to seek out and cultivate the brightest minds and give them voice, reach, and impact. Homogeneous Gold Catalysis LeGrande M. Slaughter, 2015-03-30 The series Topics in Current Chemistry presents critical reviews of the present and future trends in modern chemical research. The scope of coverage is all areas of chemical science including the interfaces with related disciplines such as biology, medicine and materials science. The goal of each thematic volume is to give the non-specialist reader, whether in academia or industry, a comprehensive insight into an area where new research is emerging which is of interest to a larger scientific audience. Each review within the volume critically surveys one aspect of that topic and places it within the context of the volume as a whole. The most significant developments of the last 5 to 10 years are presented using selected examples to illustrate the principles discussed. The coverage is not intended to be an exhaustive summary of the field or include large quantities of data, but should rather be conceptual, concentrating on the methodological thinking that will allow the non-specialist reader to understand the information presented. Contributions also offer an outlook on potential future developments in the field. Review articles for the individual volumes are invited by the volume editors. Readership: research chemists at universities or in industry, graduate students.
