External Sulphate Attack – Field Aspects and Lab Tests Esperanza Menéndez, Véronique Baroghel-Bouny, 2019-09-17 This volume gathers contributions from the final workshop of the RILEM TC-251-SRT Sulfate Resistance Testing on External

Sulfate Attack (TESA 2018), held on May 24-25, 2018 at IETcc-CSIC, Madrid, Spain. One of the Technical Committee's main events, it addressed various aspects of external sulfate attack in concrete structures and test methods. The workshop promoted technical discussions and debates on ideas on these topics, with a focus on evaluating the resistance of concrete exposed to ESA. It also provided a forum for participants from around the globe to share their experiences and research on concrete structures affected by external sulfate attack and on test methods. The book discusses the latest advances in research related to ESA and new developments in test methods, and features real-world case studies of concrete structures affected by external sulfate attack in various countries. It also presents new studies linking field cases and lab tests, including 12 contributions on 3 main themes: mechanisms of alteration in external sulfate attack; field aspects of external sulfate attack; and testing to evaluate the resistance of concrete to external sulfate attack.

Crusader Battle Lab Warfighting Experiment (BLWE) 1: Assessing Tactics, Techniques, and Procedures (TTPs) for Crusader Units Within a Synthetic Environment, 1998 The U.S. Army Research Laboratory and the Depth and Simultaneous Attack Battle Lab have performed the first Battle Lab Warfighting Experiment that evaluated operational concepts for the Crusader system. The experiment was conducted during June and July of 1996 in the Janus Battle Simulation Center at Ft. Sill, Oklahoma. The research addressed critical operation issues focused on the employment of the Crusader system on the 21st century digitized battlefield. Command and control, and ammunition logistics and resupply systems used by a direct support field artillery battalion when employing the simulated Crusader system were evaluated to identify innovative tactics, techniques, and procedures that could be introduced in conjunction with the fielding of the Crusader system. This research was conducted using a synthetic battlefield environment that placed field artillerymen into distributed interactive simulation technologies where they used actual tactical data processing equipment to perform fire support functions. There were four major outcomes of this research: (1) A preliminary set of tactics, techniques, and procedures that addressed command and control functions, situation awareness, fire order consistency, and sustainment was identified. This information will be evaluated further by the system developer and field artillery community and will be considered for additional testing during later experiments or closed loop studies. (2) Major findings were: (a) The Crusader system as currently specified, will deliver effective fires to defeat the projected threat and provide timely support to maneuver forces. (b) The pooled resupply concept was successfully demonstrated and shown to be a robust technique in the face of losses of individual resupply vehicles.
