**An Introduction to Global Environmental Issues** Kevin T. Pickering, Lewis A. Owen, 1997 An Introduction to Global Environmental Issues presents a comprehensive and stimulating introduction to the key environmental issues presently threatening our global environment. Offering an authoritative introduction to the key topics, a source of latest environmental information, and an innovative stimulus for debate, this is an essential book for all those studying or concerned with global environmental issues. Major global environmental issues are brought into focus. Explanations of the evolution of the earth's natural systems (hydrosphere, biosphere, geosphere, ecosphere) provide an essential understanding of the scientific concepts, processes and historical background to environmental issues. Contemporary socio-economic, cultural and political considerations are explored and important conceptual approaches such as Gaian hypotheses and Chaos Theory are introduced. Human impact and management of the natural environment, and concerns for maintaining biodiversity are emphasised throughout. Specific features include: \* Case studies drawn from across the world \* Superb illustrations: 4-colour plate sections; a wealth of informative diagrams \* Glossary of key terms, with key concepts highlighted throughout the text \* Annotated guides to further reading \* Chapter summaries and key points A Lecturers' Manual is available to accompany the text This 2nd Edition has been extensively revised and expanded to include many new illustrations, up-to-date data (including the latest IPCC data) and the most recent events including Kobe earthquake, French nuclear testing, the Berlin conference and the Antarctic Treaty. Sections on ecosystems, techniques, pollution, tectonics, risk and hazard mitigation, world populations, and issues of human impact and environmental management, have been particularly expanded in this new edition.

The Environmental Geoscience Dr. Alaguraja Palanichamy, Dr. Yuvaraj Dhandapani, Ms. V. Vijayalakshmi, Dr. S. Kanchana, 2023-03-21 The environment is crucial to the continued existence of life on Earth. A foundation of the biosphere, which governs the wellbeing of the whole planet earth, an ecosystem is defined as all living and non-living entities existing in the environment. Geoscience is the study of the whole Earth and the processes and forces that create and change it. It encompasses geology, geophysics, hydrogeology, mineral engineering, among many other subjects. Geoscience is at the forefront of tackling difficult issues that will have an influence on our future, such as climate change, natural resource usage, environmental degradation, and energy sustainability. Geoscience studies items that are of the highest significance, such as

minerals and fossils. The scientific study of the connections between environmental factors, human activities, and Earth processes is known as environmental geoscience. Environmental geoscientists examine how the geosphere, hydrosphere, and atmosphere have been changed by geological processes over the course of geologic time and look into the effects of human activity on these systems. The information in this book is structured such that even a reader with little background knowledge may read it and learn a great deal about environmental geoscience.

*A Biogeoscience Approach to Ecosystems* Edward A. Johnson, Yvonne E. Martin, 2016-10-13 Integrates geoscience and ecology, focusing on connections in ecological, geospheric, hydrospheric and atmospheric processes in ecosystems.

INTRODUCTION TO ENVIRONMENT MANAGEMENT M. M. SULPHEY, M. M. SAFEER, 2014-12-15 This comprehensive book, now in its third edition, brings into fore the fundamental concepts of environment management. The elegantly combined presentation of various aspects of environment, ecosystems, effects of global warming and pollution, and various ways to conserve nature and save environment, with profundity, is a highlight of this text. The third edition, while retaining the thorough coverage of the various areas of environment management—ecology, biodiversity, degradation of environment, agro-ecosystem and sustaining agriculture, forest and wildlife, waste management, emerging disciplines in environmental management, environment legislation, ethical aspects of environment—throws light on a new chapter on Ecological Dynamics and Human Influence that discusses the various environmentally significant behaviour, including environmental activism, eco-terrorism, bio-terrorism, agro-terrorism, ecotage, Green Scare, and environmental refugee. Designed as a textbook for the postgraduate students of management, this book can be equally useful for the undergraduate students of all disciplines.

**Interdisciplinary Environmental Solutions** Barnali Dixon, 2025-07-02 This textbook presents a clear and accessible argument for sustainable planning and development. The book discusses multiple environmental issues and examines how potential solutions can and should be addressed in the context of space and place. The book also offers an invaluable discussion on the need for a framework for system-based thinking where various disciplines should work together to find innovative solutions. Students are provided with an appreciation of the need for an interdisciplinary approach to these issues combined with an underlying sense of space, an appreciation of cultural diversity and differences, as well as associated insights into human relationships. These core attributes put space at the heart of environmental and natural resources management, in terms of policy, planning and on-the-ground initiatives. This book will be an invaluable reference for advanced undergraduate, graduate students and researchers working in the field looking for an accessible overview of this interdisciplinary approach to the topic.

**Geocology: An Evolutionary Approach** Richard Huggett, 2002-09-11 Animals, plants and soils interact with one another, with the terrestrial spheres, and with the rest of the Cosmos. On land, this rich interaction creates landscape systems or geoecosystems. Geocology investigates the structure and function of geoecosystems, their components and their

environment. The author develops a simple dynamic systems model, the 'brash' equation, to form the conceptual framework for the book suggesting an 'ecological' and 'evolutionary' approach. Exploring internal of 'ecological' interactions between geoecosystems and their near-surface environments - the atmosphere, hydrosphere, toposphere, and lithosphere - and external influences, both geological and cosmic, Geocology presents geoecosystems as dynamic entities constantly responding to changes within themselves and their surroundings. An 'evolutionary' view emerges of geoeological systems, and the animals, plants, and soils comprising them, providing a new way of thinking for the whole environmental complex and the rich web of interdependencies contained therein.

*Encyclopedia of Ecology* Brian D. Fath, 2018-08-23 Encyclopedia of Ecology, Second Edition, Four Volume Set continues the acclaimed work of the previous edition published in 2008. It covers all scales of biological organization, from organisms, to populations, to communities and ecosystems. Laboratory, field, simulation modelling, and theoretical approaches are presented to show how living systems sustain structure and function in space and time. New areas of focus include micro- and macro scales, molecular and genetic ecology, and global ecology (e.g., climate change, earth transformations, ecosystem services, and the food-water-energy nexus) are included. In addition, new, international experts in ecology contribute on a variety of topics. Offers the most broad-ranging and comprehensive resource available in the field of ecology Provides foundational content and suggests further reading Incorporates the expertise of over 500 outstanding investigators in the field of ecology, including top young scientists with both research and teaching experience Includes multimedia resources, such as an Interactive Map Viewer and links to a CSDMS (Community Surface Dynamics Modeling System), an open-source platform for modelers to share and link models dealing with earth system processes

**Introduction to Planetary Science** Gunter Faure, Teresa M. Mensing, 2007-05-04 This textbook details basic principles of planetary science that help to unify the study of the solar system. It is organized in a hierarchical manner so that every chapter builds upon preceding ones. Starting with historical perspectives on space exploration and the development of the scientific method, the book leads the reader through the solar system. Coverage explains that the origin and subsequent evolution of planets and their satellites can be explained by applications of certain basic principles of physics, chemistry, and celestial mechanics and that surface features of the solid bodies can be interpreted by principles of geology.

*Stability of Life on Earth*, 2004-03-02 This book shows how human activity on local, regional and global scales has perturbed natural biogeochemical cycles, colliding with Nature. The authors demonstrate how the scale and intensity of human-induced destruction of Nature and resultant feedback mechanisms have continuously expanded. They consider the likelihood of increasing numbers of natural disasters as a result of such activities, and propose that sustainable development become a principal research topic for the 21st Century.

*The Principles of Green and Sustainability Science* Adenike A. Akinsemolu, 2020-03-28 This book uses the concept of sustainability in science to address problems afflicting the environment, and to devise measures for improving economies, societies, behaviors, and people. The book pursues a scientific approach, and uses scientific evidence as the basis for achieving sustainability. The key topics addressed include: unemployment, health and disease, unsustainable production, our common future, renewable energies, waste management, environmental ethics, and harmful anthropogenic activities. Whereas past literature has mainly examined sustainability as an environmental issue, this book expands the conversation into various sciences, including mathematics, biology, agriculture, computer science, engineering, and physics, and shows how sustainability could be achieved by uniting these fields. It offers a wealth of information across various disciplines, making it not only an intriguing read but also informative and insightful.

*The Global Carbon Cycle and the Evolution of Photosynthesis* Alexander A. Ivlev, 2019-11-05 The book deals with the problem of the interaction and interconditionality of the various processes occurring in both the Earth's crust and the biosphere. It proposes a model of the global carbon cycle explaining the nature and mechanism of these interactions, showing that the key element of this interaction is the photosynthesis controlled by periodic carbon dioxide injections caused by collision zones of lithospheric plates. Changes in the environment due to the evolution of photosynthesis cause alterations in the carbon cycle, and lead to a stationary state when new features of the cycle are manifested. The main instruments of the analysis here are the isotopic technique and physico-chemical modeling, conducted on the basis of the principle of actualism. The model provides explanations of periodic mass extinctions of organisms, the "explosions of life", the uneven distribution of organic matter in the sedimentary strata, stratigraphic oil distribution, and various other events in the biosphere in the course of geological history. The book will appeal to geologists, geochemists, climatologists, ecologists, biologists, and specialists in global change.

*A Global Corporate Trust for Agroecological Integrity* John W. Head, 2019-06-14 This book examines global environmental governance and how legal, institutional, and conceptual reform can facilitate a transformation to a new 'natural-systems'

form of agriculture. Profound global climate disruption makes it essential that we replace our current agricultural system – described in this book as a fossil-carbon-dependent ‘modern extractive agriculture’ – with a natural-systems agriculture featuring perennial grains growing in polycultures, thereby mimicking the natural grassland and forest ecosystems that modern extractive agriculture has largely destroyed. After examining relevant international legal and conceptual foundations (sovereignty, federalism, global governance) and existing international organizations focusing on agriculture, the book explores legal and institutional opportunities to facilitate dramatic agricultural reform and ecological restoration. Among other things, it explains how innovative federalism structures around the world provide patterns for reorienting global environmental governance, including what the book calls eco-states that would, through exercise of pluralistic sovereignty, be responsible for agroecological management. Drawing from his experience working in international institutions, the author provides detailed global-governance proposals for facilitating the type of agricultural reform that can help avoid ecological collapse, especially through soil degradation and climate change. This book will be of great interest to students and scholars of international law, agroecology, climate change, ecological restoration, sustainable development, and global governance, as well as policy-makers and practitioners working in these fields.
